

Readme Website Instructions

Index page (Address Page) --> Nearby Restaurant --> Order Menu--> Either Checkout Page or Account Info Page--> Confirmation dialogue--> Thank you page.

1.Index:

Index page allows the user to enter the address. Address must be longer than 4 characters. Once the correct address is entered, clicking the **submit button** will take the user to the page of the nearby restaurants. Besides, the **Restaurants button** can take the user to the nearby page directly if the user just wants to look at the restaurants. Contact is a fake button.

2.Nearby:

Nearby page allows the user to pick a restaurant that the user prefers. Users can **click left and right arrow buttons** to move the scrolling menu. **Clicking any of the restaurants' logos** will take the user to the mcdonland_ordering page. (we were only able to make a menu for McDonald's so clicking any restaurant leads to the McDonald's menu.)

3.Mcdonalds_ordering:

The McDonald's menu page gives the user options to **select meals and beverages**. Each item in the menu offers **customization options**. Users can **add extra stuff or remove ingredients** they don't like. Also, users can choose different sizes for the beverages. Selecting **My Account button** will lead the user to the accountInfo page. After done with selecting items, a user can press the **Checkout order button** to go to that page.

Note: the menu does not include everything in the McDonald's menu. We did not have time to include their whole menu. However, we made sure to represent each type of item such as sides, single items, and combos as well as their different types of customization.

4.AccountInfo:

The AccountInfo page allows the user to save their information in the account information box. Users can search for history in the order history. Login button and contact are fake. There is a button titled **Save and Continue button** that will take the user to the checkout page.

5.Checkout:

The checkout page allows the user to change the address and checkout the receipt. After the **Submit button** is clicked, a small window of order confirmation will pop up. Clicking yes leads the user to the thank you page. The Back to Menu button leads the user to the mcdonalds' menu page. Payment options and credit cards are fake.

6.Confirmation:

Confirmation pops up when the user submits the receipt on the mcdonalds_ordering page.
Pressing **Yes** will take to the last Thank you page or **No** will return to the previous page.

7.Thanks page:

Thank you page pops up when the order is done.
